Report Overview

The heat collector, solar station, water storage tank and pipelines constitute the entire circulation system. As long as there is sunlight during the day, the heat collector will generate heat and generate hot water. When the temperature difference between the water outlet of the heat collector and the water storage tank reaches the system set value , the circulation pump in the solar station will start to twitch the working medium in the circulation pipeline to start, and the working medium will transfer heat to the water in the water storage tank through the coil tube, so reciprocating, the temperature of the water in the water storage tank will continue to rise, when the storage When the water temperature in the water tank is equal to the temperature of the water outlet of the collector, the water pump stops.
