## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Solder Foil competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The solder foil is a thin sheet made of solder material, mainly used for the connection between electronic components and PCB (printed circuit board). The manufacturing process of solder foil usually includes steps such as melting, forming and cooling the solder material. It has good electrical conductivity, thermal conductivity and solderability, can provide stable and reliable electrical connection during soldering, has good corrosion resistance and oxidation resistance, and plays an important role in electronic manufacturing and electronic assembly, and is also widely used in automotive, industrial, aerospace, medical and other fields. Lead solder foil contains a mixture of lead and tin and has long been a choice in the electronics industry for its low melting point, ease of use, and strong, reliable solder joint formation. In applications where reliability and easy rework are critical, such as industrial and some high-performance electronics. However, due to the health and environmental risks posed by lead, its use is restricted in many regions and applications. Lead-free solder foil is made of alternative metals, usually a combination of tin, silver, copper or other alloys, and is designed to replace traditional lead-based solder. It complies with environmental regulations such as the RoHS (Restriction of Hazardous Substances) directive. Lead-free solder foil is widely used in consumer electronics, automotive, and medical devices, where regulatory compliance and environmental safety are important. However, it generally requires a higher melting temperature than lead-containing solder and can be more challenging to handle. In the future, environmental regulations are driving manufacturers to produce lead-free and low-temperature solder foils to improve production efficiency by reducing thermal stress on sensitive electronic components.

Consumer electronics and IoT devices are moving towards miniaturization and high-density interconnection (HDI), requiring solder foil to withstand high-density circuit design. Manufacturers are increasingly focusing on producing ultra-thin solder foil with better solderability, corrosion resistance and very low void formation. New welding methods such as laser welding are also becoming more and more popular. Solder foil compatible with advanced technologies has better reliability and performance in high-tech applications.

The global Solder Foil market size was estimated at USD 67.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
