Report Overview

Solder and metal-based thermal interface materials are materials used during the joining or thermal contact of metal components and differ in their properties and applications. Solder thermal interface material is a material used to join two or more metal parts together. It is usually a fusible alloy that is heated to melt and come into contact with the surface of the metal parts, and then forms a strong bond during cooling. Metal-based thermal interface materials are materials used to improve heat conduction between metal components. They have high thermal conductivity and can be placed between the contact surfaces of metal components to fill uneven and tiny gaps, thereby improving heat conduction efficiency.
