Abstracts

Solid aluminum chlorohydrate is a group of specific aluminum salts with the general formula $Al_2Cl(OH)_2$, primarily used as an active ingredient in antiperspirant and deodorant formulations due to its ability to form temporary plugs in sweat ducts, thereby reducing perspiration. It is favored over other aluminum compounds for its efficacy at lower concentrations, reduced potential for skin irritation, and improved stability in aqueous solutions. The compound is synthesized through controlled reactions of aluminum hydroxide with hydrochloric acid, resulting in a polymeric structure that enhances its sweat-blocking properties. Its application extends beyond personal care to water treatment, where it acts as a coagulant to remove impurities, and in paper manufacturing as a retention aid, though these uses represent smaller market segments compared to its dominance in cosmetics.

The global Solid Aluminum Chlorohydrate market size was estimated at USD 210.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
