Abstracts

Solid capacitor dispersion is a meticulously formulated mixture containing conductive particles, binders, and solvents, designed to coat and form a solid electrolyte layer with high capacitance and low resistance characteristics. Its dispersibility and stability are crucial for ensuring the uniformity of the coating and the electrochemical performance. The dispersion must exhibit good fluidity and wettability to adapt to high-speed coating processes, while its viscosity needs to be precisely controlled to achieve uniform coating thickness and excellent interlayer adhesion. Furthermore, this dispersion must meet stringent technical standards, including high purity, thermal stability, and chemical inertness, to maintain its performance stability and reliability during capacitor assembly and long-term operation.

The global Solid Capacitor Dispersion market size was estimated at USD 59.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
