Report Overview

Solid carbon dioxide, commonly known as dry ice, is the solid state of carbon dioxide (CO₂). It is formed when carbon dioxide gas is cooled and pressurized to a temperature of -78.5 degrees Celsius (-109.3 degrees Fahrenheit) and a pressure of 5.11 atmospheres. Dry ice is characterized by its unique properties, such as sublimating directly from a solid to a gas without passing through a liquid phase, and its ability to absorb heat from its surroundings, making it an effective cooling agent. It is widely used in various applications, including refrigeration, food preservation, and as a component in the production of stage fog and cloud effects in the entertainment industry. Due to its potential to cause cold burns and asphyxiation, handling dry ice requires caution and proper safety measures.

In 2024, the global Solid Carbon Dioxide market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
