Abstracts

A solid conveying eductor, also known as a pneumatic conveyor or ejector, is a device that utilizes the Venturi effect to transport granular or powdered materials through a pipeline using compressed air or another gas as the motive force; it operates by creating a vacuum at the inlet through high-velocity fluid flow, which draws in solid particles from a hopper or storage container and entrains them into the conveying stream, making it an efficient, mechanically simple, and maintenance-friendly alternative to mechanical conveyors like screws or belts, particularly suitable for applications requiring dust-free operation, moderate transport distances, and flexibility in installation where space constraints or the need to avoid product degradation are considerations.

The global Solid Conveying Eductors market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
