Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Solid Electrolyte Thin Film competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Solid electrolyte film is a solid material layer used for ion conduction. It forms a dense film with a thickness of nanometer to micrometer on the surface of the substrate through physical or chemical deposition processes (such as magnetron sputtering, atomic layer deposition, sol-gel method). Its core function is to replace liquid electrolytes and realize efficient transmission of cations (such as Li⁺, Na⁺) or anions in electrochemical devices such as solid-state batteries. It also has zero flammability, wide electrochemical window (>5V), high mechanical strength and interface stability with electrode materials. Solid electrolyte film needs to meet the requirements of high ionic conductivity (>10⁻² S/cm), low electronic conductivity and thermal/chemical inertness. It is a key component of the next generation of high energy density and high safety energy storage devices.

The global Solid Electrolyte Thin Film market size was estimated at USD 477.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
