Abstracts

A solid gyroscope is a gyroscope that uses the principle of rigid body dynamics to measure rotational speed. It uses the rotational inertia of solid materials to detect angular velocity, and has the characteristics of high precision and good reliability. A solid gyroscope is a sensor that can accurately measure the angular motion of an object in inertial space, including rotational speed, direction, and angle. It is based on the gyroscopic effect, that is, a rotating object (gyroscope) will resist changes in direction. When the gyroscope rotates, its rotation axis will maintain a fixed direction and will not be affected by the tilt or rotation of the bracket.

The global Solid Gyroscope market size was estimated at USD 635.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
