## Abstracts

Rocket fuel refers to the propellant or fuel used to propel a rocket. It is a specialized type of fuel that provides the necessary energy for a rocket to lift off, achieve orbit, or escape Earth's gravity. Rocket fuels can be either solid, liquid, or, in some advanced cases, gaseous. They are designed to burn rapidly and efficiently to produce large amounts of thrust. Common types of rocket fuels include liquid oxygen and liquid hydrogen (for high performance and efficiency), kerosene or RP-1 (a refined form of kerosene used in some rockets), and solid propellants (mixtures of powdered metals and oxidizers formed into a solid shape). Rocket fuels are crucial for the operation of rockets, enabling them to achieve the high speeds and altitudes necessary for space exploration and other applications.

The global Solid and Liquid Fuel for Rocket market size was estimated at USD 125.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
