Abstracts

Solid polymer proton exchange membrane fuel cell is a fuel cell that uses hydrogen-containing fuel and air to generate electricity and heat. Solid polymer proton exchange membrane fuel cells operate at relatively low temperatures (below 100 degrees Celsius) and can tailor electrical output to meet dynamic power requirements. Due to the relatively low temperatures and the use of precious metal-based electrodes, these cells must operate on pure hydrogen. PEMFCs are widely used in a variety of applications including transportation, portable power, and stationary power generation. Growing demand for renewable energy adoption on the grid, coupled with widespread availability of reliable and low-emission equipment, will drive business trends. Improvements in catalysts, membrane materials and stack designs have extended their service life and reduced maintenance costs due to high energy conversion efficiencies, fuel flexibility and ongoing research and development efforts, coupled with the advancement of proton exchange membrane fuel cells in stationary applications. The increasing deployment will boost industry dynamics. The fast start-up and response times of PEMFCs enable fast and efficient power delivery, coupled with increasing investment in the development of fuel cell infrastructure, the growing demand for fuel cell electric vehicles as an alternative to existing vehicles, coupled with the rapid development of technology. Progress in launching new products will stimulate product adoption.

The global Solid Polymer Proton Exchange Membrane Fuel Cell market size was estimated at USD 1834.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 31.90% during the forecast period.
