Abstracts

Solid rocket propellant is a pre-mixed, self-contained energetic material used in rocket motors that contains both fuel and oxidizer components within a solid, rubbery, or composite matrix, eliminating the need for separate storage and handling systems like those in liquid propulsion; once ignited, it burns at a predictable rate along a pre-designed grain geometry to produce high-thrust, high-reliability propulsion, making it particularly suitable for applications requiring simplicity, storability, rapid response, and robust performance such as military missiles, space launch boosters, and tactical munitions.

The global Solid Rocket Propellant market size was estimated at USD 1125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
