Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Solid Sawn Timber Connectors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Solid sawn timber connectors are a type of structural hardware specifically designed to connect solid sawn lumber components (such as beams, columns, and trusses). They are widely used in timber-framed buildings, trussed roofs, wooden decks, and residential framing. Sales in 2024 were expected to reach 10.6 million units, with an average price of \$6.30 each. These connectors are typically made of high-strength steel and treated with galvanized or epoxy coatings for corrosion protection, offering excellent load-bearing capacity and resistance to shear and tension. Common types include angle brackets, joist hangers, bolt clamps, anchor plates, and toothed plate connectors. These can be fastened to solid wood components with nails, bolts, or screws to achieve secure connections at multiple angles and in multiple directions. Compared to glulam structures, solid sawn timber requires higher compressive stability in connectors. Therefore, these connectors are typically designed according to the US ANSI/AF&PA NDS or European EN 14545 standards and are a critical component in achieving the stability and long-term durability of timber structures.

The global Solid Sawn Timber Connectors market size was estimated at USD 67.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.30% during the forecast period.
