Abstracts

Solid sodium metaaluminate is an important inorganic chemical product, which easily absorbs moisture and carbon dioxide in the air. When it dissolves in water, aluminum hydroxide precipitates. In addition, sodium metaaluminate will form white aluminum hydroxide precipitate when encountering weak acids and a small amount of strong acids, while it will form corresponding aluminum salts when encountering excessive strong acids. There are various methods for producing solid sodium metaaluminate, among which a common method is to use bauxite as raw material and prepare it through steps such as crushing, ball milling, wet grinding, high-pressure dissolution, sedimentation separation, filtration, and evaporation to dryness. In addition, it can also be prepared by using waste liquid (such as mold waste liquid), which not only solves the problem of waste liquid discharge, but also realizes the resource utilization of sodium metaaluminate.

The global Solid Sodium Metaaluminate market size was estimated at USD 146.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
