Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Solid State Battery Silicon Carbon Negative Electrode competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In a solid-state battery, the traditional liquid electrolyte is replaced by a solid electrolyte, which improves safety, energy density, and thermal stability. When paired with a silicon-carbon composite negative electrode, the battery benefits from the extremely high theoretical capacity of silicon (about 10 times higher than graphite). However, pure silicon tends to expand significantly during charging, which can cause mechanical degradation. To mitigate this, silicon is blended with carbon materials that provide structural support, electrical conductivity, and buffering against volume changes. This combination results in a more stable, higher-performance anode that, when used in solid-state batteries, contributes to longer cycle life, greater energy density, and improved safety over conventional lithium-ion batteries. These batteries are promising candidates for next-generation electric vehicles, wearables, and grid storage.

The global Solid State Battery Silicon Carbon Negative Electrode market size was estimated at USD 661.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
