Report Overview

Sensors are devices that can sense or detect a physical property. Solid-state sensors are the sensors with no mobile parts. Sometimes these sensors are confused with transducers or actuators that are supposed to react depending on the sensor response. The signal processing unit controls the whole system between sensor and actuator. While using a solid state sensor it is necessary to have the sensor device and the signal processing unit on the same chip because the signal processing unit in it can be built as a semiconductor device
