Abstracts

Solid - state Supercontinuum Sources refer to a type of light - emitting devices that generate an extremely broad and continuous spectrum of light through nonlinear optical processes in solid - state materials. These sources are based on solid - state lasers as the initial excitation source. When a high - intensity laser beam from the solid - state laser propagates through a suitable nonlinear optical medium such as a special crystal or glass, various nonlinear optical effects like self - phase modulation, cross - phase modulation, and four - wave mixing occur. These effects cause the spectral broadening of the original laser beam, resulting in a supercontinuum that spans a wide range of wavelengths from the ultraviolet to the infrared regions. The solid - state nature of these sources provides advantages such as high - power output, good stability, and compact design, making them useful in applications such as optical coherence tomography, spectroscopy, and optical communications.

The global Solid-state Supercontinuum Sources market size was estimated at USD 177.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
