Report Overview

Solid samples are often received for analysis in a damp or wet state. Removal of water or drying the sample to constant weight is usually necessary for a reliable assay. Inorganic samples such as soil should be heated at a temperature from 1000 – 1100.0C to ensure the removal of moisture. Drying by using microwave irradiation, nowadays also is a suitable option. Hydrophobic organic samples seldom re-quire heating, since water absorption is minimal. Organic vapors can also be adsorbed by solid organic samples, and a heating step can remove these contaminants.
