### Report Overview

Soluble microneedle is a drug delivery system (DDS) that promotes penetration of drugs and active ingredients into the body safely and efficiently. Soluble microneedles are made by mixing active ingredients with dissolvable polymers to create a micron-sized needle shape that naturally dissolves away after skin insertion. These offer various advantages: First, the microneedle is a less painful way of delivering active ingredients compared with the syringe. This can potentially improve the quality of life for those who would otherwise need frequent injections. Second, the dissolvable microneedle is an environmentally friendly solution, leaving no dangerous or wasteful products behind, such as needles or glass, because microneedles dissolve into the skin after insertion. Third, cold-chain supply costs are reduced, because the solid state of the dissolvable microneedle enables greater stability during the distribution of various biopharmaceuticals without the need for refrigeration.
