Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Solvent-based Laminator Machine for Packaging competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.In 2024, global Solvent-based Laminator Machine for Packaging production reached approximately 593 units, with an average global market price of around K US$ 458.5per unit. Solvent-based Laminator Machine is a packaging converting tool that bonds multiple substrates (e.g., plastic films, aluminum foil, paper) using adhesives dissolved in organic solvents (such as ethyl acetate, toluene, or methyl ethyl ketone). The process begins with applying the solvent-based adhesive to one substrate via a roller system, followed by passage through a drying tunnel—where heated air (60–100°C) evaporates the solvents, leaving a tacky adhesive layer. The second substrate is then pressed against the adhesive-coated surface under pressure, forming a laminated composite. This machine is valued for its strong bonding strength, versatility with diverse substrates (including high-barrier materials like metallized films), and suitability for heavy-duty packaging applications such as retort pouches, industrial wraps, and multi-layered snack bags. However, it requires ventilation systems to manage volatile organic compound (VOC) emissions, faces stricter regulatory scrutiny (e.g., EU REACH, U.S. EPA standards), and has higher energy costs due to the drying stage.

The global Solvent-based Laminator Machine for Packaging market size was estimated at USD 272.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.30% during the forecast period.
