## Abstracts

Pad printing, also called tampography or tampo printing, is an indirect offset (gravure) printing process where a silicon pad takes a 2-D image from a laser engraved (etched) printing plate (also called cliché?) and transfers it to a 3-D object. Thanks to pad printing, it is now possible to print all kind of difficult shaped products such as curved (convex), hollow (concave), cylindrical, spherical, compound angles, textures, etc. which were not available with traditional printing processes. Solvent ink is largely used as a common pad printing ink. Solvent-based pad printing ink is a type of ink used in the pad printing process, characterized by using solvents as carriers. During the pad printing process, solvent-based pad printing ink is transferred from the printing plate onto a flexible silicone or rubber pad, which is then pressed onto the substrate to transfer the image. Solvent-based pad printing ink offers excellent adhesion and durability, making it suitable for various substrates such as plastics, metals, ceramics, providing clear and vibrant image results.

The global Solvent-based Pad Printing Ink market size was estimated at USD 276.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
