Report Overview:

Sonar for civilian ships is a sound wave technology device widely used on civilian ships for navigation, depth measurement, fish detection and terrain survey in underwater environments. Sonar uses the characteristics of sound waves to travel through water, which can help boat operators better understand underwater conditions to ensure safe and effective navigation. The basic principle of sonar for civilian ships is to emit sound waves into the water and then measure the time it takes for these sound waves to reflect back from underwater objects. According to the propagation speed and echo time of the sound wave, the distance of the underwater object can be calculated, so as to realize the depth measurement. In addition, sonar can also detect underwater obstacles, measure water depth, display underwater terrain, and help anglers find schools of fish.

The Global Sonar for Civilian Ships Market Size was estimated at USD 722.52 million in 2023 and is projected to reach USD 1036.57 million by 2029, exhibiting a CAGR of 6.20% during the forecast period.
