### Report Overview

Sonic Cleaning Horn produce vibrations at relatively low frequencies in order to remove soot and other buildups of particulates from chimneys, catalyst beds, or other process vessels. They can reach areas that are inaccessible to slag and ash removal devices such as long soot blowers, wall blowers, and water cannons. Acoustic horns are relatively inexpensive to operate, but must be used frequently in order to prevent the buildup of undesirable particles. Most products achieve sound pressures of approximately 150 dB and work over two ranges of operating frequency. Acoustic horns that work in the infrasonic or near-infrasonic frequency range are used mainly with boilers and selective catalytic reduction (SCR) reactors. Acoustic horns that operate above 75 Hz are designed to avoid resonance with other plant equipment. Acoustic horn suppliers are located across North America and around the world. Some companies refer to their products as sonic horns or acoustic cleaners.
