Report Overview

The oscillator within the drill head generates a high-frequency, resonant energy which is directed down into the drill string.

During drilling the resonant energy is combined with rotational movement. This evenly distributes the energy which impacts the drill bit and drill string of tooling. The drill operator can control the amount of sonic vibration the drill head generates to match the force needed to optimally penetrate the soil and bedrock formations. The vibrations of the drill bit cause the soil to lose structure which changes density and porosity. This way the soil & cuttings move in the sample barrel and up the drill string to help the tooling advance freely. This report focuses on Sonic Drill Rigs market.
