Abstracts

A Soxhlet Extraction Fat Analyzer is a laboratory instrument designed specifically to determine the fat content in various samples through the Soxhlet extraction method. It operates by repeatedly cycling a solvent, typically an organic solvent like petroleum ether or ethyl acetate, through a sample contained in a thimble. The solvent extracts the fat from the sample as it is heated and refluxed in a Soxhlet apparatus. After a series of extraction cycles, the solvent containing the dissolved fat is then separated and the fat is recovered, usually by evaporating the solvent, allowing for the quantification of the crude fat content in the sample. This type of analyzer is widely used in food, feed, and other industries for accurate and reliable fat analysis.

The global Soxhlet Extraction Fat Analyzer market size was estimated at USD 706.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
