Report Overview

Soybean, scientifically classified as *Glycine max*, is a globally significant leguminous crop cultivated primarily for its protein- and oil-rich seeds. These seeds are processed into a wide variety of products such as soybean oil, soybean meal, and soy protein derivatives including isolates, concentrates, and textured proteins. Soybeans serve as a major source of plant-based protein for human consumption and are a key input in livestock feed, particularly for poultry, pigs, and cattle. In addition, soybean oil is widely used in the food industry, as well as in the production of biodiesel and various industrial applications. Owing to its nutrient density, versatility, and efficiency in cultivation, soybean has become one of the most important and traded agricultural commodities worldwide, with its value chain extending across food, feed, fuel, and fiber sectors. In 2024, the global soybean market is estimated to reach approximately \$212 billion USD, driven by robust demand across both traditional and emerging applications. The market is projected to grow at a compound annual growth rate (CAGR) of around 4.3% from 2024 to 2033. This growth is primarily fueled by increasing demand for plant-based proteins, rising meat consumption that drives the need for animal feed, and the expanding use of soy derivatives in industrial and biofuel applications. In addition, the ongoing global transition toward sustainable agriculture and renewable energy has positioned soybean as a critical crop for achieving environmental goals. At the same time, the development of genetically modified (GM) and non-GMO soybean variants has enabled farmers to improve yield efficiency and cater to diverse consumer preferences in both Western and Asian markets.

This report offers a comprehensive and in-depth analysis of the global Soybean market, covering all critical facets from a broad macroeconomic overview to detailed micro-level
