Abstracts

Space cargo transportation services refer to commercial or government services that transport materials, equipment or scientific payloads from the Earth to space (such as low-Earth orbit, the Moon, Mars, etc.). Currently, space cargo transportation services are rapidly developing towards greater capabilities, lower costs, and more diverse business models. Taking China's Tianzhou series as an example, their cargo carrying capacity reaches up to 6.9 tons, with the most recent Tianzhou-9 increasing it to approximately 6.5 tons, setting a new record in the application and development phase of my country's space station. Simultaneously, rendezvous and docking time has been significantly reduced from two days to approximately three hours, achieving true "space flash delivery." To significantly reduce transportation costs, countries are exploring reusable transportation systems. For example, China is developing the Haolong cargo space shuttle and the Qingzhou cargo spacecraft. The former can land horizontally on an airport runway like an airplane and can be reused after inspection and maintenance. In addition to traditional point-to-point transportation, a new market called "space tugboat services" is emerging.

The global Space Cargo Transport Service market size was estimated at USD 1495.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.30% during the forecast period.
