Report Overview:

Space is an extremely hazardous environment with the presence of lethal radiation, micrometeoroids, highly fluctuating temperatures, and man-made debris, which may cause different types of issues for electronic components from simple bit flips to the dangerous complete burnout of electronic systems. The effects produced by the radiation on the space electronics, such as Single Event Effect (SEE) and Total Ionizing Dose (TID), can be rectified by the radiation-hardening process. The process makes the electronic components capable to operate reliably for eons in the harsh space environment but at a very high cost.

The Global Space Electronics Market Size was estimated at USD 1170.66 million in 2023 and is projected to reach USD 1397.83 million by 2029, exhibiting a CAGR of 3.00% during the forecast period.
