## Abstracts

The Space Grade Inertial Navigation System is based on the principle of inertial navigation. It uses inertial sensors such as gyroscopes and accelerometers installed on the spacecraft to measure the acceleration and angular velocity of the spacecraft in the inertial reference system. Through integral operations, the system can autonomously calculate the motion state of the spacecraft, such as position, velocity and attitude, without relying on external signals or reference sources. This system has extremely high autonomy, concealment and anti-interference capabilities, and can work stably in complex environments such as space.

The global Space Grade Inertial Navigation System market size was estimated at USD 2240.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
