Abstracts

Spaceborne synthetic aperture radar is an active microwave imaging sensor installed on space vehicles such as satellites. It uses the principle of synthetic aperture to obtain high-resolution radar images similar to optical photography under extremely low visibility meteorological conditions. Spaceborne SAR has global observation capabilities, has the characteristics of long range, all-day, all-weather, etc., and can effectively identify camouflage and penetrate cover; at the same time, by transmitting large time bandwidth product signals, such as linear frequency modulation signals, through pulse compression, obtaining high resolution in the range direction has become an important means of earth observation and has received widespread attention from various countries.

The global Spaceborne SAR market size was estimated at USD 2180.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
