Abstracts

Spacecraft batteries are specialized energy storage devices meticulously engineered to meet the unique power requirements of spacecraft operating in the challenging environment of outer space. These batteries serve as the primary or secondary power source, supplying electrical energy to various onboard systems, including communication equipment, navigation systems, scientific instruments, and life support systems. They are designed to withstand extreme conditions such as wide temperature variations, radiation, and microgravity. Depending on the mission requirements and spacecraft design, different types of batteries are utilized, such as nickel-cadmium, nickel-hydrogen, or lithium-ion batteries. Spacecraft batteries must have a high energy density to store a significant amount of power in a relatively small and lightweight package, enabling long-duration missions. They also need to have excellent reliability and a long lifespan to ensure consistent performance throughout the spacecraft's operational period, as replacing or recharging them in space is often extremely difficult or even impossible. Overall, spacecraft batteries play a crucial and indispensable role in enabling the successful execution of space missions and the exploration of the cosmos.

The global Spacecraft Batteries market size was estimated at USD 2863.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
