Report Overview

Spacecraft solar arrays are assemblies of solar panels designed to convert sunlight into electrical power to operate spacecraft systems and instruments. These arrays are typically made from photovoltaic cells that harness solar energy by converting photons into electricity. They are crucial for powering satellites, space stations, and deep-space probes, enabling long-duration missions by providing a reliable and renewable energy source. Spacecraft solar arrays are engineered to be lightweight, durable, and efficient, often featuring mechanisms to deploy and orient the panels towards the Sun for optimal energy capture. Their design must withstand the harsh conditions of space, including extreme temperatures, radiation, and micro-meteoroid impacts, ensuring the continuous operation of the spacecraft throughout its mission.
