## Abstracts

Spacecraft solar panels are devices used to convert sunlight into electrical energy to power spacecraft systems and instruments. These panels are made up of photovoltaic cells, usually composed of silicon or other semiconductor materials, that generate electricity when exposed to sunlight. Solar panels are crucial for the long-term operation of spacecraft, providing a renewable and sustainable energy source, especially for missions in orbit around Earth or traveling through the solar system. They are designed to withstand the harsh conditions of space, including extreme temperatures and radiation. The efficiency, size, and deployment mechanism of the solar panels are critical factors in the design and success of space missions, ensuring that spacecraft have a reliable power supply to perform scientific experiments, communication, navigation, and other essential functions.
