Single-cell sequencing analysis provides a practical way to define cell types and states that can help understand normal cellular processes and the regulation of gene expression in various diseases. However, the process of tissue dissociation can lead to loss of spatial context and can also preferentially select certain cell types or perturb cell states due to dissociation or other environmental stresses. Spatial epigenomics has emerged to address these challenges, revolutionizing our understanding of gene regulation and cellular function. To investigate the mechanisms underlying the spatial organization of different cell types and functions in the tissue environment, it is necessary to examine not only gene expression but also the epigenetic basis, such as chromatin accessibility, in a spatially resolved manner.

The global Spatial Epigenomics market size was estimated at USD 93.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Spatial Epigenomics market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
