Abstracts

A Spatial Molecular Imager (SMI) is an advanced scientific instrument used for visualizing and analyzing the spatial distribution of molecules within cells and tissues. The representative product is the CosMx? Spatial Molecular Imager developed by NanoString. It utilizes cyclic in-situ hybridization chemistry, automated microscopy, and a microfluidic system to achieve multi-target detection. Fluorescent probe in-situ hybridization is used to directly count RNA transcripts without the need for reverse transcription and PCR amplification. Technical parameters: It can detect at least 18,000 RNA and 75 protein targets at single-cell resolution. The objective lens has a magnification of 22.77X and a numerical aperture of 1.1, with a field of view (FOV) size of 0.51 mm x 0.51 mm, and it is compatible with four-color fluorescence channels. Sample compatibility: It is compatible with various types of samples, including fresh frozen tissue samples, formalin-fixed paraffin-embedded (FFPE) tissue samples, organoids, and cultured cells. Functions and applications: It can be used for cell atlas construction, cell typing, disease state research, ligand-receptor interaction analysis, biomarker discovery, and tissue microenvironment research, helping researchers gain a deeper understanding of biological processes and disease mechanisms.

The global Spatial Molecular Imager (SMI) market size was estimated at USD 122.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
