Abstracts

Spatial biology is the two-dimensional and three-dimensional study of gene and protein expression and their corresponding interactions with the cellular environment. By analyzing the real-time molecular behavior of multiple markers, spatial biologists can begin to piece together a larger picture of cell and tissue function. Spatial proteomics can detect proteins, splice variants, and other post-translational modifications in single or large cell populations, and can detect dozens of proteins at the same time. Proteomic-based data can promote clinical research and develop viable treatments for patients. Global spatial proteomics is one of the fastest growing segments in the field of life science tools. The core engines of market growth come from tumor microenvironment research (especially immunotherapy biomarker development) and drug development needs (target validation, mechanism of action analysis), driving pharmaceutical giants and biotechnology companies to become major purchasers. On the technical level, antibody-labeled in situ imaging platforms (such as Akoya PhenoCycler, Standard BioTools Hyperion) dominate the mainstream, and the application scenarios continue to expand with the upgrade of multiple detection capabilities (>100 proteins), automation and data analysis capabilities. The competitive landscape is jointly dominated by focused technology companies (Akoya, IONpath) and traditional instrument giants (Thermo Fisher, Bruker). Future market expansion will rely on breakthroughs in clinical transformation and multi-omics integrated solutions.

The global Spatial Proteomics market size was estimated at USD 346.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.30% during the forecast period.
