## Abstracts

A Spatial Tandem Mass Spectrometer (Spatial MS/MS) is an advanced variation of traditional tandem mass spectrometry that integrates spatially resolved mass spectrometry with ion fragmentation techniques. This technology allows for the precise spatial localization of ions within a sample, enabling the analysis of heterogeneous samples, such as tissues, surfaces, or complex materials, with high spatial resolution. In Spatial MS/MS, ions are first selected based on their mass-to-charge ratio in the initial mass spectrometer stage, then fragmented in a collision cell. The resulting fragments are then analyzed in the second mass spectrometer stage, providing both structural and spatial information. This technique is particularly valuable in fields like imaging mass spectrometry, biological research, and materials science, where understanding the distribution of molecules within a specific spatial context is crucial. Spatial MS/MS is gaining traction in areas like proteomics, metabolomics, and cancer research, where tissue-specific molecular profiles can be mapped with unprecedented detail, aiding in disease diagnostics and drug development. The Spatial Tandem Mass Spectrometer market is experiencing significant growth, driven by the increasing demand for high-resolution, spatially resolved molecular analysis in fields like proteomics, cancer research, personalized medicine, and materials science. The ability to analyze molecular distributions within tissue samples, surfaces, and complex materials with high spatial resolution is fueling the adoption of this technology in both academic and clinical research. Advances in imaging mass spectrometry and improvements in data analysis software are enhancing the capabilities and accessibility of Spatial MS/MS systems, making them more affordable and user-friendly. The growing focus on precision medicine, biomarker discovery, and understanding disease mechanisms at the molecular level is accelerating the demand for spatial mass spectrometry in medical research, particularly for studying tissue heterogeneity in cancers and neurological disorders. Additionally, the need for detailed molecular mapping in environmental

science and materials research is further contributing to the market's expansion. As the technology matures and becomes more integrated with other high-throughput techniques, the Spatial Tandem Mass Spectrometer market is expected to see continued growth, particularly in emerging markets and specialized research sectors.

The global Spatial Tandem Mass Spectrometer market size was estimated at USD 1842.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
