Abstracts

Spatial transcriptomics sequencing is an advanced molecular biology technique that combines the principles of transcriptomics (the study of the complete set of RNA transcripts in a cell or tissue) with spatial information. It enables the simultaneous measurement of gene expression levels and the determination of the location of those transcripts within a tissue sample. By preserving the spatial context of gene expression, this technology provides a more comprehensive understanding of how genes are expressed in different regions of a tissue, which is crucial for elucidating complex biological processes, disease mechanisms, and cellular interactions. It typically involves methods to capture and sequence RNA molecules directly from specific locations within a tissue section, followed by computational analysis to map the gene expression data back to their spatial coordinates.

The global Spatial Transcriptomics Sequencing market size was estimated at USD 138.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
