Report Overview

SPDT time-delay relay is an electrical control device, usually used to control the switch of electrical equipment in a circuit, and has a time-delay function. It has two output channels, and each channel contains a switch that can control two different circuits. The main feature of the SPDT time-delay relay is that it has a single-pole double-throw (DPDT) switching function in the circuit, that is, it can switch two different circuits, each circuit has a normally open and a normally closed contact. It also has a delay function, which can delay the switch operation for a period of time after triggering. SPDT time-delay relays usually consist of a control unit and one or more relay outputs. The control unit contains a timer and a trigger, and the delay time and trigger conditions can be set according to the user's needs. When the trigger condition is met, the control unit sends a signal to the relay output, and the relay output switches the state of the switching circuit. SPDT time-delay relays are widely used in various fields, such as: industrial automation, building automation, lighting control, electric curtains, etc. It has the characteristics of high reliability, convenient installation and simple use.
