Abstracts

Spectral irradiance sensors are precision optoelectronic instruments designed to measure the spectral power distribution of light sources across specific wavelength ranges, typically operating within the ultraviolet, visible, and near-infrared spectra. These devices quantify irradiance—the radiant flux received per unit area—in wavelength-dependent units (e.g., W/m²/nm), providing critical data for applications such as solar energy assessment, material testing, environmental monitoring, agricultural optimization, and photobiological research. By capturing detailed spectral characteristics rather than integrated broadband values, they enable accurate analysis of light quality, composition, and intensity, which is essential for industries requiring precise photometric or radiometric calibration, compliance with spectral standards, or evaluation of light-source performance under controlled or natural conditions.

The global Spectral Irradiance Sensor market size was estimated at USD 48.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
