Report Overview:

Interactive Voice Response (IVR) is an automated telephony system technology that interacts with the callers, gathers the required information and routes the calls to the particular appropriate recipient.

With the modern, sophisticated IVR systems, you can gather the input and responses through spoken words with the voice recognition. Conversations are either pre-recorded or generated audio which assists, directs, or guides customers automatically without a live operator.

Within these interactions, clients can communicate by using either the touch-tone keypad selection or voice telephone input. The responses take the form of voice, call-back or any other related media.

IVR software enables an organization to use prerecorded greetings or menu options that a customer can access through a phone keypad. Advanced IVR systems may include speech recognition software to enable a customer to communicate with a computer. Many companies have augmented or replaced IVR systems with automated speech recognition technologies that enable callers to speak their requests instead of punching numbers into their phones. These voice recognition systems can frustrate callers if the system doesn't recognize a caller's questions.

The Global Speech Based Interactive Voice Response Software Market Size was estimated at USD 1017.19 million in 2023 and is projected to reach USD 2018.53
