## Abstracts

Spent Fuel Storage Containers are specialized containers designed to safely store spent nuclear fuel after it has been removed from a reactor. These containers are built to provide shielding, structural integrity, and heat dissipation to prevent radiation exposure and overheating. They are typically made of high-strength materials such as stainless steel and reinforced concrete, ensuring long-term containment and security. Spent fuel storage can be categorized into wet storage (using water pools) and dry storage (using casks or canisters) to accommodate different cooling and shielding requirements. These containers play a crucial role in managing nuclear waste until it can be reprocessed or permanently disposed of in a geological repository.

The global Spent Fuel Storage Containers market size was estimated at USD 1385.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
