Abstracts

SPF (Spray Polyurethane Foam) and OCF (One-Component Foam) are two foam materials widely used for building insulation, sealing and filling, with excellent thermal insulation, sealing and waterproof properties. SPF is a two-component polyurethane foam. Two chemical components (isocyanate and polyol) are mixed by special equipment and foamed and cured in the form of spraying. SPF has high density, excellent thermal insulation and good adhesion, and is widely used in building walls, roof insulation, pipeline protection and other fields. OCF is a one-component polyurethane foam, usually packaged in aerosol cans, sprayed directly through a nozzle during construction, and cured when exposed to moisture. OCF is mainly used in scenes such as door and window caulking, crack repair, and pipeline sealing. Market Trends SPF and OCF foams are mainly used in building insulation, sealing, and structural reinforcement. Globally, the focus on improving building energy efficiency and reducing carbon emissions has driven the demand for high-efficiency insulation materials. With the recovery of the residential and commercial construction markets, especially in North America and Europe, the demand for new projects and renovation of existing buildings has surged, further promoting the application of these foam materials. Market Disadvantages High-quality SPF and OCF foams usually use expensive raw materials and technical processes, resulting in relatively high prices, which may be unaffordable for small projects or companies with limited budgets. Secondly, the operation and technical thresholds are high. The correct use and maintenance of these materials requires professional knowledge and experience, and improper operation may lead to quality problems or safety hazards. Market Outlook The development of new materials and new processes will further optimize the performance of SPF and OCF foams, reduce production costs, improve cost-effectiveness, and make them more competitive in the market. For example, the application of nanotechnology and smart materials can significantly improve the thermal insulation performance and

durability of foam materials. Secondly, with the deepening of global attention to sustainable development, green manufacturing has become an important direction for the development of the industry. Manufacturers are exploring how to reduce the carbon footprint in the production process and adopt more environmentally friendly production processes to meet increasingly stringent environmental standards.

The global SPF and OCF Foam market size was estimated at USD 3512.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
