Report Overview:

Spherical alumina is a thermally conductive functional filler made of industrial alumina powder as raw material through multiple processes such as purification, dynamic combustion into balls, precision classification, surface modification, compounding, and homogenization. The physical and chemical properties of alumina powder are stable, strong adsorption capacity, high hardness, and the spherical structure makes it have a larger specific surface area and better fluidity.

Spherical alumina preparation process:

1. Ball milling method (high energy ball milling)

Ball milling is the most common method for preparing plagiarized alumina powder. The ball mill itself is a horizontal type, with a built-in steel ball grinding medium, so that after the material enters the cylinder, it will collide with the steel ball to produce an impact force to achieve a crushing effect. Adding grinding aids in the ball milling process can improve the uniformity of powder particle size.

2. Polymer network sol-gel method

Advantages: small particle size; disadvantages: poor sphericity

The Global Spherical Alumina Filler Market Size was estimated at USD 335.01 million in 2023 and is projected to reach USD 812.00 million by 2029, exhibiting a CAGR of 15.90% during the forecast period.
