Abstracts

Spherical bronze powder is a specialized metallic powder characterized by its spherical particle morphology and composition primarily of copper and tin, with possible minor additions of other elements like zinc or phosphorus to modify properties; it is engineered for high flowability, consistent packing density, and uniform surface coverage, making it distinct from irregular or flake-shaped bronze powders used in other applications. This material is produced through processes such as atomization, where molten bronze is dispersed into fine droplets that solidify into spheres, resulting in a product with low surface area-to-volume ratio, excellent sinterability, and enhanced performance in applications requiring precise metallurgical, electrical, or aesthetic properties.

The global Spherical Bronze Powder market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
