Report Overview

Spherical mirrors are curved so that reflected beams converge on a focal point. Important parameters to consider when searching for spherical mirrors include diameter, radius of curvature, thickness, and focal length. The diameter of the mirror if viewed straight on can also be thought of as the height. If a mirror's curvature was extrapolated into a sphere, the radius of that sphere is the radius of curvature for that mirror. The thickness can be specified as center thickness or edge thickness. Focal length is the distance from the spherical mirror the light converges. Mirror material refers to the classification of the material used to make spherical mirrors. The material used influences the reflectivity characteristics of the spherical mirror. Choices include BK7 glass, copper, fused silica, nickel, optical crown glass, and UV grade fused silica.
