Report Overview

Spin Cleaning Equipment for Semiconductors adopts the rotation technology to realize the cleaning function. The cleaning method: the dissolving effect of the sprayed liquid is used to dissolve the stains on the surface of the silicon wafer, and the centrifugal effect of high-speed rotation is used to make the liquid dissolved with impurities separate from the surface of the silicon wafer in time. At the same time, due to the relatively high relative speed between the sprayed liquid and the rotating silicon wafer, a large impact force will be generated to achieve removal of adsorbed impurities. After cleaning, use inert gas to directly dry to complete the cleaning of the silicon wafer.

The global Spin Cleaning Equipment For Semiconductors market size was estimated at USD 1200.85 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
