Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Spin-coated Filter competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Spin-coated filters are made by coating a substrate with a specific material using a spin coating process. They selectively filter or absorb specific wavelengths of light. This technology is widely used in smartphone cameras to improve image quality, reduce infrared interference, eliminate ghosting, and enable color display in color LCD panels. In 2024, global production of spin-coated filters reached 183 million units, with an average selling price of \$0.70 per unit. Typical single-line production capacity is approximately 6,000-10,000 units per year, resulting in an industry gross profit margin of approximately 40%-50%. Cost structure: Raw materials account for approximately 72%, manufacturing overhead accounts for approximately 17%, and labor costs account for the remaining 11%. The upstream industry chain comprises optical glass, synthetic resins, coating materials, coating equipment, and spin-coating equipment; the downstream industry comprises smartphones (currently primarily used in high-end phones) and cameras.

The global Spin-coated Filter market size was estimated at USD 128.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 17.30% during the forecast period.
