Report Overview

Spin-on Glass (SOG) is a local planarization technology used in the semiconductor manufacturing process. It fills the recessed holes of the deposited dielectric layer by evenly coating a liquid solvent containing dielectric material on the wafer surface by spin coating. The spin coating process produces a thin layer of silicon film. These films are coated on silicon wafers and have different properties after baking. This material is used in the early development stage of semiconductors. In the semiconductor manufacturing process, planarization technology is essential to improve device performance and reliability. As an effective planarization technology, Spin-on Glass (SOG) has been widely used in the field of semiconductor manufacturing.
