### Report Overview

Spinal cord stimulation (SCS) systems are indicated as an aid in the management of chronic, intractable pain of the trunk and/or limbs, including unilateral or bilateral pain associated with the following: failed back surgery syndrome, nonsurgical back pain (without prior surgery and not a candidate for back surgery), and diabetic peripheral neuropathy of the lower extremities. Spinal Column Stimulation A spinal cord stimulator (SCS) is a small device, similar to a pacemaker, that uses electrical impulses to relieve chronic pain of the back, arms, and legs. The device masks pain signals before they reach the brain. Spinal cord stimulation (SCS) systems are indicated as an aid in the management of chronic, intractable pain of the trunk and/or limbs, including unilateral or bilateral pain associated with the following: failed back surgery syndrome, nonsurgical back pain, and diabetic peripheral neuropathy of the lower extremities. Spinal Column Stimulation (SCS) Systems is designed to deliver low-intensity electrical impulses to nerve structures. The system is intended to be used with leads and associated extensions that are compatible with the system. SCS systems have a small implanted pulse generator, called a stimulator, and thin wires called leads. These are implanted into your body. The stimulator delivers tiny pulses of mild electric current through the leads to specific nerves on the spinal cord. These impulses mask pain signals traveling to the brain. There are a few types of SCS implants, but each is comprised of three main parts: A battery-powered pulse generator which creates the electrical charge. A lead wire with several electrodes which deliver an electrical charge to the spinal cord. A hand-held remote to power the device on and off and to adjust the settings.
